PYFLORIBOTVISION PACKAGE

1.1 pyfloribotvision Package

1.2 PyFloribotVision Module

class pyfloribotvision.PyFloribotVision.**PyFloribotVision** (*configFile, loggingConfig, relativePath=True*)

Bases: object

Application-Startup handling Startup-Parameters

__init__ (*configFile, loggingConfig, relativePath=True*)
Object initialization

Parameters

- **configFile** – path to the plugin config
- **loggingConfig** – path to the logging config
- **relativePath** – if given paths not relative this should be set to False (default True)

checkConfigExist ()
checks if config files are exists and readable

executeApplicationContext ()
execute configured behavior (invoke plugin methods)

initApplicationContext (*pluginprefix*)
initializes the application context

Parameters pluginprefix – plugins should be relative under ./plugins if class invoked through a startup-script or another application, the prefix have to point into the package where the plugin-package could be find

pyfloribotvision.PyFloribotVision.**main** (*name, argv*)
Startup entry point, parsing commandline parameter

Parameters

- **name** – Name of the script which was executed
- **argv** – the list of command line arguments passed to the Python script

1.3 Subpackages

1.3.1 controller Package

controller Package

ConfigController Module

class pyfloribotvision.controller.ConfigController.**ConfigController** (*configFileName*)
Bases: object

Simple Wrapper for the ConfigParser. Loads the Configuration-File and Convert its Data into a Dictionary Structure. Each Section becomes a Key for the tob-level dict and serves the Option Values in an dict again

__init__ (*configFileName*)

Load the rawConfig from Config-File with the ConfigParser and convert the rawConfig into a dict structure

Parameters *configFileName* – Path to the Configuration-File

convertRawConfigToDict (*rawConfig=None*)

Converts the rawConfig into a dict structure and returns them

Parameters *rawConfig* – rawConfig from ConfigParser (default None)

getConfig ()

Returns the config as dict

getOption (*sectionname, optionname*)

Returns the value from the option which belongs to the given sectionname

Parameters

- **sectionname** – name of the section
- **optionname** – name of the option which value will be returned

getSection (*sectionname*)

Returns the whole section from the dict-config

Parameters *sectionname* – name of the section which will be returned

DataLinkController Module

class pyfloribotvision.controller.DataLinkController.**DataLinkController**
Bases: object

Class for data-exchange between the plugins

__init__ ()

Creates internal dictionary

getValue (*item*)

Returns the value corresponding to key (item)

Parameters *item* (*object*) – key object in the square parenthesis

Returns entry of the dictionary

Return type object

setValue (*key, value*)

set value to the internal dictionary

Parameters

- **key** – key to set

- **value** – value to set for the given key

PluginController Module

class pyfloribotvision.controller.PluginController.**PluginController** (*pluginprefix*)
Bases: object

The PluginController handles loading and finding of the Plugins

__init__ (*pluginprefix*)
Initializes the PluginController and load its Plugins

Parameters **pluginprefix** –

findPlugin (*item, _itemList=None*)
Find a Plugin and returns it if found, otherwise None

Parameters

- **item** – the Plugin to search for if item is an instance of str the format is according to a relative import in the plugin package. e.g.: ‘opencv.cvDrawContours’
- **_itemList** – only for recursion purpose, should not be used due to cache mechanisms (default: None)

loadPlugins (*module=None, forceReload=False*)
Load Plugins from ‘plugin’ package and returns them as dict

Parameters

- **module** – Python-Module to search in (default: None)
- **forceReload** – True forces reload of cached PluginList (default: False)

1.3.2 dto Package

dto Package

PluginDTO Module

class pyfloribotvision.dto.PluginDTO.**PluginDTO**
Bases: object
Plugin-Data-Object for compact access to all Plugin - no logic
__init__ ()

1.3.3 manager Package

manager Package

ContextManager Module

class pyfloribotvision.manager.ContextManager.**ContextManager** (*contextName=None*)
Bases: object
Prepare Application-Context and give the ability to access the Context trough normal initialisation for a given Pseudo-Namespace. The ContextManager provides the Plugins-, Configuration- and DataLink-Controller as well as the ProcessManager.
__init__ (*contextName=None*)
Initialize a new instance per given contextName. Every new init for a known contextName returns previously initialized instance for corresponding context.

Parameters **contextName** – specifies the context (default None)

executeContext ()

Triggers the executePlugins Method from the ProcessManager

initContext (*configFileName, loggingConfigFileName, pluginprefix*)

Initializes the Controller, Manager and Logger for given configuration data.

Parameters

- **configFileName** – Configuration-File for the ConfigController
- **loggingConfigFileName** – Configuration-File for the Logger
- **pluginprefix** – Prefix where the Plugin-Package can be found

ProcessManager Module

class pyfloribotvision.manager.ProcessManager.**ProcessManager** (*pluginController, configController, dataLinkController*)

Bases: object

Manages the Process and is responsibly for the runtime behavior

__init__ (*pluginController, configController, dataLinkController*)

Gets the 'GENERAL' section from the ConfigController and acquires and instantiate the Plugins specified by the 'pluginSequence' Option in the Configuration

Parameters

- **pluginController** – Instance of the PluginController
- **configController** – Instance of the ConfigController
- **dataLinkController** – Instance of the DataLinkController

acquirePlugins (*generalConfigSection=None*)

Acquire the Plugins specified by the 'pluginSequence' Option in the Configuration given by the dict generalConfigSection or internal config if generalConfigSection is None. Furthermore returns a list of PluginDto for each loaded Plugin whose Name in the pluginSequence Option don't start with an exclamation mark

Parameters **generalConfigSection** – Config for 'GENERAL' section (default None)

executePlugins (*pluginDtoList=None*)

instantiatePlugins (*pluginDtoList=None*)

Instantiate the Plugins in the list of PluginDto's and return the List

Parameters **pluginDtoList** – List of PluginDto's (default None)

triggerPluginMethods (*methodName, pluginDtoList=None*)

Triggers the corresponding methods of the active Plugins in the pluginDtoList

Parameters

- **methodName** – Name of the Plugin-Method to trigger
- **pluginDtoList** – List of PluginDto's (default None)

1.3.4 plugins Package

plugins Package

BaseModule Module

```
class pyfloribotvision.plugins.BaseModule.BaseModule (**kwargs)
    Bases: object
    __init__ (**kwargs)
    externalCall ()
    loadOptions ()
    obligatoryConfigOptions = {}
    postOptActions ()
    preOptActions ()
    timeBypassActions ()
```

Subpackages

floribot Package

floribot Package

FilePickleSegmentOutput Module

```
class pyfloribotvision.plugins.floribot.FilePickleSegmentOutput.FilePickleSegmentOutput (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    appendOutputDataToCache ()
    externalCall ()
    obligatoryConfigOptions = {'inputImageName': None, 'outputFile': None, 'inputContourName': None, 'createCache': None}
    postOptActions ()
    preOptActions ()
    writeCacheToFile ()
```

opencv Package

opencv Package

CVBitwiseOr Module

```
class pyfloribotvision.plugins.opencv.CVBitwiseOr.CVBitwiseOr (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'outputImageName': None, 'inputImageName1': None, 'inputImageName2': None}
```

CVContourConstraint Module

```
class pyfloribotvision.plugins.opencv.CVContourConstraint(**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule

    __init__(**kwargs)

    externalCall()

    obligatoryConfigOptions = {'contourFunctions': None, 'resultPlaceholderName': None, 'inputContourName': None}

    postOptActions()
```

CVDrawContours Module

```
class pyfloribotvision.plugins.opencv.CVDrawContours(**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule

    if inputContourIndexListName is empty, then draw all contours

    __init__(**kwargs)

    externalCall()

    obligatoryConfigOptions = {'inputImageName': None, 'inputContourIndexListName': None, 'inputContourName': None}

    postOptActions()
```

CVFindContours Module

```
class pyfloribotvision.plugins.opencv.CVFindContours(**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule

    __init__(**kwargs)

    externalCall()

    obligatoryConfigOptions = {'inputImageName': None, 'cvMode': None, 'outputHierarchyName': None, 'cvMaskName': None}

    postOptActions()
```

CVGaussBlur Module

```
class pyfloribotvision.plugins.opencv.CVGaussBlur(**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule

    __init__(**kwargs)

    externalCall()

    obligatoryConfigOptions = {'inputImageName': None, 'sigmaY': None, 'outputImageName': None, 'sigmaX': None}

    postOptActions()
```

CVInRange Module

```
class pyfloribotvision.plugins.opencv.CVInRange(**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule

    __init__(**kwargs)

    externalCall()

    obligatoryConfigOptions = {'inputImageName': None, 'cvValueListNames': None, 'outputMaskListNames': None}

    postOptActions()
```

CVMorphologyEx Module

```
class pyfloribotvision.plugins.opencv.CVMorphologyEx.CVMorphologyEx (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'inputImageName': None, 'cvOperation': None, 'outputImageName': None, 'inp
    postOptActions ()
```

CVStructuringElement Module

```
class pyfloribotvision.plugins.opencv.CVStructuringElement.CVStructuringElement (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'outputElementName': None, 'cvKSize': None, 'cvShape': None}
    postOptActions ()
```

CVTransformColor Module

```
class pyfloribotvision.plugins.opencv.CVTransformColor.CVTransformColor (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'inputImageName': None, 'colorCode': None, 'outputImageName': None}
    postOptActions ()
```

CVValueList Module

```
class pyfloribotvision.plugins.opencv.CVValueList.CVValueList (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'runCycle': ['oneShoot', 'loop'], 'inputValues': None, 'outputNames': None, 'inp
    postOptActions ()
```

DirectCVCamSource Module

```
class pyfloribotvision.plugins.opencv.DirectCVCamSource.DirectCVCamSource (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    initCam ()
    obligatoryConfigOptions = {'camId': None, 'outputImageName': None, 'frameHeight': None, 'frameWidth':
    postOptActions ()
    timeBypassActions ()
```

DirectCVImageSource Module

```
class pyfloribotvision.plugins.opencv.DirectCVImageSource.DirectCVImageSource (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'inputImageFile': None, 'outputImageName': None}
    postOptActions ()
```

FileCVImageOutput Module

```
class pyfloribotvision.plugins.opencv.FileCVImageOutput.FileCVImageOutput (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'inputImageName': None, 'outputImageFile': None}
    postOptActions ()
```

ScreenCVImageOutput Module

```
class pyfloribotvision.plugins.opencv.ScreenCVImageOutput.ScreenCVImageOutput (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'inputImageList': None}
    postOptActions ()
```

python Package

python Package

DeltaTimePerFrame Module

```
class pyfloribotvision.plugins.python.DeltaTimePerFrame.DeltaTimePerFrame (**kwargs)
    Bases: pyfloribotvision.plugins.BaseModule.BaseModule
    __init__ (**kwargs)
    externalCall ()
    obligatoryConfigOptions = {'startFrame': None, 'stopFrame': None, 'displayTime': ['True', 'False']}
    postOptActions ()
    preOptActions ()
    printTime (time)
```
